                                                                                                                                                                                                            Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lys 414) and Phe at position 118 being deleted. Alternatively, Phe 118 can be replaced with any other amino acid. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in several with lung thrombus or myocardial infarction. See also AAQ10230 and AAR10196-R10200.

Streptokinase derivative having a C-terminal deletion (i.e. Pro 373-Lyg 414) and Pro residues being inserted next to Lyg at both positions 256 and 257. Derivatives show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in patients with lung thrombus or myocardial infarction. See also AQ10230, AAR10195-7 and AAR10199-R10200.
                                                                                                                                                                                                                                                                                                                                                                Synthetic gene encoding streptokinase - scale, high purity prodn. of streptokinase used as a thrombolytic agent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

example of a streptokinase derivative which is a combination of two individually claimed modifications. Derivatives between the stability is a show a decreased antigenicity, higher stability in blood and greater selectivity of thrombolytic activity and specificity. The protein is used as a thrombolytic agent in spatients with lung thromboly or myocardial infarction. See also AAQ10230, AAR10195-8 and AAR10200.

                                                                                                            Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                       The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating mycoardial infartion, pulmonary thromboembolism, surgical complications and other forms of thrombosis.

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antipolicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolylic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY25009-Y25019 are novel peptides derived from streptckinase that ameliorate cell death. The products of the invention and their encoding nucleic acids may be useful for treating diseases and conditions related to aging, cellular differentiation, physical insult (e.g. physical trauma, anoxia, hyperthermia, hypothermia, chemically induced damage, and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin and any other organ), viral disorders (e.g. hepatitis, retroviral infections, viral encephalitis, and AIDS/HIV), neurodegenerative disorders (e.g. parkinson's disease, Alzheimer's disease, Huntington's disease, cerebellar degenerations, and familial amyotrophic lateral sclerosis (FALS)), candidovacular disease (e.g. atherosclerosis, myocardial infarction, heart failure, cardiomyopathy, myocardial
                                                                         Gарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptides that ameliorate cell death useful for treating conditions associated with cellular differentiation

SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptides obtained from streptokinase, useful in ameliorating cell death due to apoptosis and/or necrosis and treating neurodegenerative, neoplastic, immune, cardiovascular and inflammatory disorders

```
The invention relates to an isolated peptide obtained from streptokinase, or its derivative or analog, which ameliorate cell death. The activity of peptides of the invention may be described as, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, cytostatic, antimifiammatory, antiparkinsonian, anticonvulsant, cytostatic, antimifiammatory, antiathritic, antirheumatic, cardiant, consistences of the invention are useful computations of antiulcer, antidabetic, antianaemic, virucide, ophthalmological, antidabetic, antidaemic, virucides of the invention are useful for treating comprising peptides of the invention are useful for treating concerning diseases (e.g. harkinson's, Alzheimer's, Huntington's disease and cerebellar degeneration) neoplastic diseaders including cancer, inflammatory disorders (e.g. arthritis; inflammatory joint diseases and cardiovascular diseases (e.g. heart failure, atherosclerosis and myocardial reperfusion injury), immune diseases (e.g. autoimmune cystemic lupus erythematosus, diabetes mellitus, pernicious anaemia), myelodegenerative diseases, viral diseases, and degenerative diseases, ulcerative colitis, cataractes, and crementaled aging. The current sequence represents a representative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cell death; streptokinase; neurodegenerative disorder; leukaemia; AIDS; Parkinson's disease; Alzheimer's disease; cardiovascular disease; trauma; atherosclerosis; myocardial infarction; immune disease; carcinoma; rheumatoid arthritis; mopplastic disorder; inflammatory disorder; arthritis; inflammatory induced cell damage; motor neuron disease; arthritis; inflammatory induced cell damage; motor neuron disease; physical insult; severe shock; ischaemia; reperfusion injury; hepatitis; cell dath associated procedure; spinal cord reperfusion injury; toxic insult; liver toxicity; pulmonary toxicity; spinal cord disease; Guillain-Bare syndrome; bypass surgery; myocardial ischaemia; chemotherapp; viral disease; viral encephalitis; infectious disease; bacterial disease; prion-based disease; macular degeneration; cataract formation; pancreatitis; Crohn's disease; ulcerative colitis; accelerated aging; oxidative stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /label= 18mer_peptide
/note= "Cell death ameliorating peptide. Specifically
claimed in claim 2. This is SEQ ID NO 5 as shown
in the sequence listing"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell death ameliorating peptide. The invention relates to a pharmaceutical composition, which comprises a peptide capable of ameliorating cell death, its derivative or analogue, comprising a sequence Val-Asp-Val, where the peptide is in a suitable pharmaceutical carrier or diluent. The pharmaceutical composition comprising the peptide) is useful for treating or preventing cell death associated with a neurodegenerative disorder e.g. Parkinson's catheroscleropis and myocardial infarction; immune disease e.g. AIDS and alsease and Alzheimer's disease; cardiovascular disease e.g. AIDS and atheroscleropis and myocardial infarction; immune disease e.g. AIDS and inflammatory disorder e.g. arthritis and inflammatory induced cell damage; disease caused by physical insult e.g. trauma and severe shock; inflammatory disorder e.g. arthritis and inflammatory induced cell damage; disease caused by physical insult e.g. trauma and severe shock; inchaemia or reperfusion injury e.g. myocardial ischaemia and spinal cord certical insult e.g. invertoxicity and pulmonary corticity, spinal cord disease e.g. motor neuron disease and Guillain-Bare syndrome; procedures associated with cell death e.g. bypass surgery and chemotherapy; viral disease e.g. hepatitis and viral encephalitis; cohurs disease; infectious diseases e.g. hepatitis and viral encephalitis; uncertaine colitis, accelerated aging and oxidative stress in a warm-blooded animal. The present sequence represents the amino acid sequence of a representative streptoxinase from which the cell death ameliorating peptides are produced.

                                                                                                                                                                                                               The SKC-2 gene was isolated from S.equisimilis type C by gene amplification from the synthetic primers SK1, SK2 and SK3 (see AAQ20666-8). The SKC-2 gene was inserted into yeast expression vector PS-7 for extracellular expression of streptokinase and into pNAO for intracellular expression in yeast. For expression in bacteria, the SKC-2 gene was inserted in plasmid pEKG3, between a trp promoter and a T4 terminator.

induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence represents native streptokinase at least two-fold. The present
   present invention describes an isolated bacterial protein that

New polypeptides which bind streptokinase-specific antibodies useful in thrombolytic therapy

Disclosure, Page 12; 44pp; English.

The present sequence represents a native streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also

The present sequence represents native SK. SK is a secretory procein of haemolytic Streptococcus able to activate human plasminogen (HPIG) to plasmin (HPIM), which is a serine protease able to catalyse the plasmin (HPIM), which is a serine protease able to catalyse the agent in the treatment of vascular thrombombolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the KS9E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.
                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus equisimilis H46A, streptokinase, mutant; fibrinolytic; plaama clot, hydrolysis, haemolytic Streptococcus; plasmingen; plasmin, serine protease; fibrin; blood clot; thrombolytic; vascular thrombolytic; symptom; acute myocardial infarction;
describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. P1 is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic
                                                                                                                                                             .

The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPIg) to plasmin (HPIm), which is a serine protease able to catalyse the agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cell epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunospanicity of the protein when exposed to the immunospanicity of the protein when exposed to the immunospanic the pays a method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The immunoglobulins or therapeutic protein of the immunoglobulins or therapeutic protein the products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of a de-immunised SK protein molecule.

```
This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are deadled fusion between the streptokinase (SK), which are deadled fusion between the streptokinase (SK), which are deadled fusion between the streptokinase (SK), which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the bablity to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable and pronounced duration, or lag, after exposure of the PA to a suitable candiovascular disorders. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action that man of plasmin fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation cencountered during clinical use of streptokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            as

AAB01295 standard; protein; 414 AA.

RESULT 40 AAB01295 Wild type streptokinase from Streptococcus equisimilis.

Immunogenicity; immunogen; T cell epitope; T-lymphocyte; drug; vaccine; carriter; diagnosis; therapy; complement; C3; C5; CVF; plaeminogen; streptokinase; fibrin; blood clot; thrombolysis; plaemin; myocardial infarction.

Streptococcus equisimilis

```
Proteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for the producing a protein with an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive drugs to its active form within a living organism. The method can be needed active or introduced within the living organism in order to alter the bid distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a therapeutic or a diagnostic agent. Streptowkinase is produced by certain strains of beta-haemolytic streptococci. The protein has no inherent enzymatic activity but has considerable clinical importance of inherent enzymatic activity but has considerable clinical importance of inherent is sativation to plasmin and thereby promoting the effective thrombolytic agent in the treatment of croonary thrombosis, or improving survival and preserving left ventricular function following production of neutralising antibodies in humans generally limits the protein to a single use. The new method could provide a longer therapeutic use for streptokinase. The altered streptokinase sequence is singiven in AAB01296. See GENDESEQ records AAB01289-B01302.
                                                                                                                                                                                                                                                                                           Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 30; DB 21; Length 414; 100.0%; Pred. Altered streptokinase from Streptococcus equisimilis.

Immunogenicity; immunogen; T cell epitope; T-lymphocyte; drug; vaccine; carrier; diagnosis; therapy; complement; C3; C5; CVF; plasminogen; streptokinase; fibrin; blood clot; thrombolysis;

```
Proteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell ceptopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for the immune system of another organism. The method can be used for the producing a protein with an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive drugs to its active form within a living organism, a vaccine, a protein used as a carrier of other molecule or a protein which binds to other molecules within or introduced within the living organism in order to alter the bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medianosis, dispnosis and in manufacture of a terminatic of beca-haemolytic streptochiase is produced by certain strains of beca-haemolytic streptochiase is produced by cortein the activity but has considerable clinical importance of inherent enzymatic activity but has considerable clinical importance of inherent enzymatic activity but has considerable clinical importance of insolution to efficiently bind human plasminogen, the dissolution of fibrin filaments in blood clots Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, importance of improving survival and preserving left ventricular function following mycardial infarction. The native protein is immunogenic and the protein to a production of neutralising antibodies in humans generally limits the coronary manner of coronary humans generally limits the protein to a neutralish was manner when a coronary humans generally limits the
                                                                                                                                                                                                                                                                                                                                                                                                                                  Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of the altered streptokinase. The wild type streptokinase sequence is given in AAB01295. See GENESEQ records AAB01289-B01302.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention describes a method to create mutants of streptokinase (SK) which become more resistant to hydrolytic inactivation by human plasmin (HPIM) and more effective in activation of chuman plasmin (HPIM) and more effective in activation of chuman plasmin (HPIM) than the native SK that is commercially available. The novel HPIM hydrolysis resistant SK can be created by the near the peptide bonds that are hydrolysed by HPIM. The mutant SK can be used to form HPID and native SK and could be used as a thrombolytic agent. The mutant SK sequence could be coupled with other proteins to form fusion proteins and improve the fibrinolytic activity of the fusion proteins. Some truncated SKs such as SKIG-378) could activate HPIG as efficiently as native SK. The truncated SKs comprising the modification of ProS8-LysS-Ser60-Lys61 to other amino acids would have a better thrombolytic activity than the corresponding native truncated SK. Since LysS-Ser60 is among the few peptide bonds which are cleaved in the early reaction with HPIM and the NH2-terminal peptide chain of 116-LysS9 is essential in stabilising the structure of SK, the mutation at/or near by the peptide bond and might improve the stability of the hydrolysis of the peptide bond and might improve the stability of streptokinase (KSBE) given in the present sequence represents the mutant streptokinase (KSBE) given in the present invention.

N.B. The present sequence corresponds to the indexers best interpretation or print.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preparation of novel streptokinase mutants as improved thrombolytic

The present sequence is streptokinase, a single-peptide secretory protein which is produced by various strains of haemolytic Streptococcus. Streptokinase forms a tight binding complex with human plasminogen, causing the spontaneous conversion of plasminogen to its active form, plasmin. Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Plasmin is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen activators regulate plasminogen expression either by forming a binding complex, as in the case of streptokinase, or by hydrolysing a peptide bond in plasminogen to convert it to plasmin. Review of sequence homologies of several plasminogen activators and chymotrypsin has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length chuman plasminogen. Novel plasminogen activators have been made based upon chuman plasminogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·

Streptokinase produced using E.coli transformed with a recombinant streptokinase vector can be isolated for use as a thrombolytic agent to facilitate the in vivo lysis or dissolution of blood clots. The vector is esp. a plasmid obtd. from E.coli, esp. plasmid pBR 322. Recombinant plasmid pMF1 as defined by a restriction endonuclease map is claimed. Escherichia coli HB 101 harbouring plasmid pMF1 is deposited as ATCC 39613.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptokinase A; recombinant phage; thrombolytic agent; plasminogen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel thrombolytic agent comprising streptokinase where at least one nonessential portion has been modified. The invention also describes a method of forming a thrombolytic agent comprising determining a nonessential portion of streptokinase and modifying the nonessential portion to render the resulting protein less antigenic. The modified streptokinase is used to treat blood clot disorders, such as heart attacks. The modified streptokinase has less antigenicity than streptokinase but is still able to complex plasminogen and lead to plasminogen activation. Modified streptokinase with the nonessential portions removed or truncated simplify the molecule. Such smaller proteins are cheaper and easier to produce. This sequence represents a fragment of a Streptococcus sp. streptokinase protein which is used in the description of the method of the invention.

                                                                                                                                                                 ·.
       Lambda L47.1 is ligated with genomic DNA from S. pyogenes SF130/13 and the resultant product used to transform bacteria. Infected cells are cultured in liq. medium contg. assimilable C and N sources, and streptokinase A is isolated from the cell lysate. The infected cells provide the protein in high yields, i.e. 1000 U/ml compared to 80 U/m, for the donor strain. The protein activates the autocatalytic conversion of human plaminogen to human plasmin, so is potentially useful as a thronbolytic (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Plasmid pWN1 (contg. the streptokinase G gene ) is ligated with pUC19 and the resultant product used to transform bacteria. Infected cells are cultured in 1iq. medium contg. assimilable C and N sources, and streptokinase G is isolated from the cell lysate.

The infected cells provide the protein in high yields, i.e. 600 U/ml which is 1.5-2 times that for the donor strain. The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thronbolytic agent. See also DD-276634 (AAQ05664).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence was deduced from PCR amplified chromosomal DNA from S. equisimils (Lancefield's Gp C ) ATCC 10009 or ATCC 9642. The primars used for the PCR were based on the published DNA sequence of S. equisimils strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 157-362 [1981]). See Swiss-Prot K02986 and P00779 and Geneseq N70106. The gene can be used to construct expression vectors in which the streptokinase gene is linked to a second gene encoding e.g. another streptokinase protein, hirudin, or a streptokinase-like protein, via a linking sequence encoding a cleavage site for e.g. factor Xa or thrombin. The enzymes which cleave fusion protein are present at the site of the target thrombus so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the active agents are released specifically at the place where clot
formation is occurring.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fusion protein cleavage by blood clotting enzyme - for prodn. of fractions having greater antithrombotic activity for therapy and

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 543 sequences (31), given in the specification. The proteins have antibacterial and antiinflammatory activity. [1], nucleic acids encoding (1), ABN6604-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (1) are used to detect Streptococcus in a biological sample. (1) is are used to detecraine whether a compound binds to (1). A composition comprising (1) or a nucleic acid encoding (1), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningits. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy. Antibodies to (1) are used for affinity contractors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.

The protein is a recombinant product of a gene fusion construct.

The sequence of the synthetic hirudin HV-1 genes was designed based on the published manho acid sequence (bodt J., et al FEBS Letters 165 180 (1984)). The sequence of streptokinase was obtd.

From PCR amplified chromosomal DNA from S. equisimilis ATCC 10009 or ATCC 9942. The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). The two sequences were used to construct an expression vector in which the hirudin gene is linked to the streptokinase gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are cleased specifically at the place where clot formation is occurring. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Squence 42, Application US/09737149

Patent No. US20020077466A1

GENERAL INFORMATION:

APPLICANT: Spadern K

APPLICANT: Shimkers, Richard A.

APPLICANT: Spinkers, Richard A.

APPLICANT: Muralidhara, Padigaru

APPLICANT: Muralidhara, Padigaru

APPLICANT: Spikek, Kimberly A.

TITLE OF INVENTION: Polypeptides and Nucleic Acids Encoding Same

FILE REFERENT Spikek, Sinchard A.

FILE REFERENT Spikek, Sinchard A.

PRIOR PLICATION NUMBER: US/09/737,149

Sequence 1049, Application US/10289762
Publication No. US20040006218A1
GENERAL INFORMATION:
APPLICATION: Chiamydia pneumoniae genomic sequence and polypeptides, fragment
ITILE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prev
ITILE OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/10/289,762
CURRENT FILING DATE: 2003-03-27
NUMBER OF SEQ ID NOS: 6849
SEQ ID NO 1049

TITLE OF INVENTION: EXPRESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF TITLE OF INVENTION: PLANTS WITH IMPROVED PROPERTIES
FILE REPERENCE: 38-10 (52052) B
CURRENT APPLICATION NUMBER: US/10/369, 493
CURRENT PILING DATE: 2002-02-28
PRIOR FILING DATE: 2002-02-21
NUMBER OF SEQ ID NOS: 47374
SEQ ID NO 16538
LENGTH: 287
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0

```

GENERAL

INFORMATION:

APPLICANT: Krystal, Gerald
APPLICANT: Rabkin, Simon W.
TITLE OF INVENTION: No. 6348567el Peptides
TITLE OF INVENTION: Ameliorate Cell Death
FILE REFERENCE: 50216/003003
CURRENT PEPLICATION NUMBER: US/09/294,457
CURRENT FILING DATE: 1999-04-19

and Their Use to

Patent N. 6562958

GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUKANNI FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7836
LENGTH: 626
LENGTH: 626
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4507, Application US/09328352
